## The Project's Part I : SFG Program

### Introduction :

- This program implements a computational tool for analyzing Signal Flow Graphs (SFGs).
- It automates the application of Mason's Gain Formula to determine the transfer function of linear control systems represented by SFGs.

### Methodology :

- The program identifies key components of the SFG, including forward paths between specified input and output nodes.
- It detects all individual feedback loops within the graph.
- The algorithm accounts for non-touching loops of various orders.
- Mason's Gain Formula is applied by calculating the path gains and the determinant ( $\Delta$ ) of the graph, along with the cofactors ( $\Delta_k$ ) for each forward path.

### Program Features/Functionality :

- Users can graphically construct SFGs through a friendly interface.
- The program allows for the definition of nodes and the assignment of gains ( forward and feedback )to branches.
- It identifies forward paths and loops based on the graph structure.
- Calculates the overall transfer function in symbolic or numeric form.

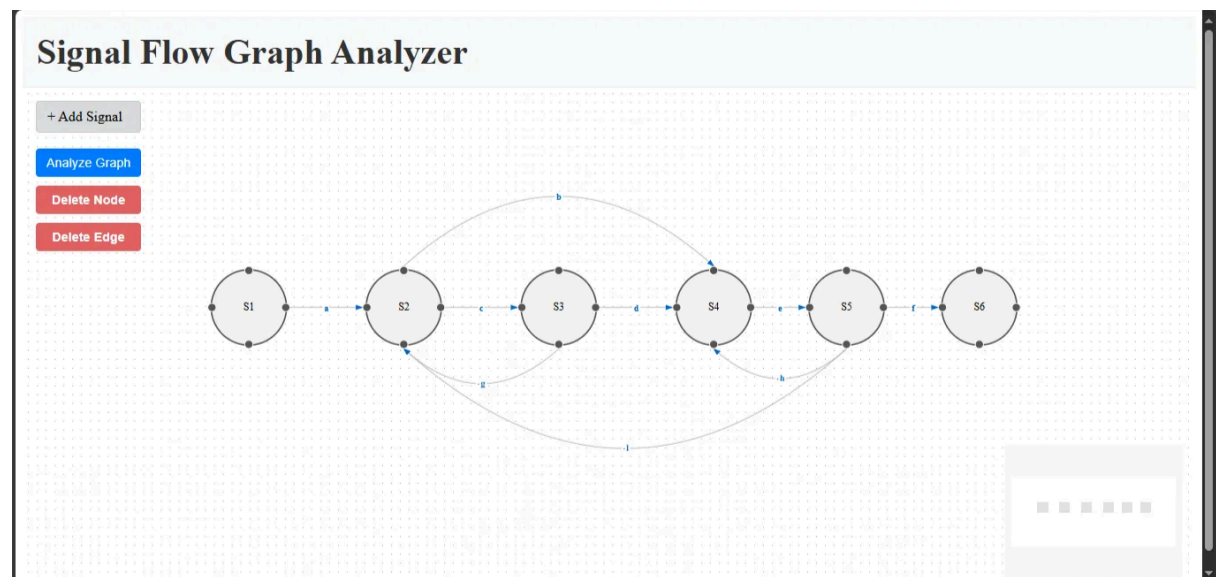

- Intermediate steps, such as the identification of loops, forward paths, and the Delta are presented to the user.
- Results are displayed clearly

## Example 1 :

[2] Find the gains  $\frac{y_6}{y_1}$ ,  $\frac{y_3}{y_1}$  and  $\frac{y_5}{y_2}$  for the signal flow graph in the following figure.

First : Get Y6/Y1 of the Problem :

### Signal Flow Graph Analysis

**Transfer Function**

Expression:  $(P1 + P2)/(1 - L1 - L2 - L3 - L4 + L1 * L4)$

Numeric Value:  $a * e * f * (b + c * d) / (b * e * l + c * d * e * l + c * e * g * h + c * g + e * h + 1)$

**Determinant ( $\Delta$ )**

Expression:  $1 - L1 - L2 - L3 - L4 + L1 * L4$

Numeric Value:  $b * e * l + c * d * e * l + c * e * g * h + c * g + e * h + 1$

**Forward Paths**

ID	Path	Gain	Path Determinant
P1	S1->S2->S3->S4->S5->S6	$a * c * d * e * f$	1
P2	S1->S2->S4->S5->S6	$a * b * e * f$	1

Expression:  $1 - L1 - L2 - L3 - L4 + L1 * L4$

Numeric Value:  $b * e * l + c * d * e * l + c * e * g * h + c * g + e * h + 1$

**Forward Paths**

ID	Path	Gain	Path Determinant
P1	S1->S2->S3->S4->S5->S6	$a * c * d * e * f$	1
P2	S1->S2->S4->S5->S6	$a * b * e * f$	1

**Loops**

ID	Loop	Gain
L1	S2->S3->S2	$-c * g$
L2	S2->S4->S5->S2	$-b * e * l$
L3	S2->S3->S4->S5->S2	$-c * d * e * l$
L4	S4->S5->S4	$-e * h$

Close

The correct Answer From Sheet :

$$\frac{y_6}{y_1} = \frac{M_1 \Delta_1 + M_2 \Delta_2}{\Delta} = \frac{a c d e f + a b e f}{1 + c g + e h + c d e l + b e l + e g e h}$$

The Program's Answer and the Sheet Answer are Same

The Program Successfully Answered Manson's Formula Correct of **Y6/Y1**

**Second : Get Y3/Y1 of the same Problem :**

**Signal Flow Graph Analysis**

Transfer Function

Expression:  $(P1 * (1 - L4)) / (1 - L1 - L2 - L3 - L4 + L1 * L4)$

Numeric Value:  $a * c * (e * h + 1) / (b * e * l + c * d * e * l + c * e * g * h + c * g + e * h + 1)$

Determinant ( $\Delta$ )

Expression:  $1 - L1 - L2 - L3 - L4 + L1 * L4$

Numeric Value:  $b * e * l + c * d * e * l + c * e * g * h + c * g + e * h + 1$

Forward Paths

ID	Path	Gain	Path Determinant
P1	S1->S2->S3	$a * c$	$1 - L4$

Loops

Expression:  $1 - L1 - L2 - L3 - L4 + L1 * L4$

Numeric Value:  $b * e * l + c * d * e * l + c * e * g * h + c * g + e * h + 1$

Forward Paths

ID	Path	Gain	Path Determinant
P1	S1->S2->S3	$a * c$	$1 - L4$

Loops

ID	Loop	Gain
L1	S2->S3->S2	$-c * g$
L2	S2->S4->S5->S2	$-b * e * l$
L3	S2->S3->S4->S5->S2	$-c * d * e * l$
L4	S4->S5->S4	$-e * h$

Close

$$\frac{y_3}{y_1} = \frac{M_1 \Delta_1}{\Delta} = \frac{ac(1+eh)}{1+cg+eh+cde l + bel + cge h}$$

In Conclusion : The program and the Sheet answer are the Same

The Program Correctly Calculated Manson's Formula to get the Characteristic Equation

**Third : Get Y5/Y2 of the Same Problem :**

### Sheet's Formula $Y5/Y2 = Y5/Y1 * Y1/Y2$

BY applying Manson's Formula Directly we were able to get  $Y5/Y2$  By identifying the forward Paths from  $Y2$  to  $Y5$  and the non-touching loops in the entire graph to determine the common delta

Skipping  $Y1$  instruction would then apply to the identification of the forward paths from  $Y2$  to  $Y5$

**So, The sheets Answer and the Program are Exactly the same putting into consideration**

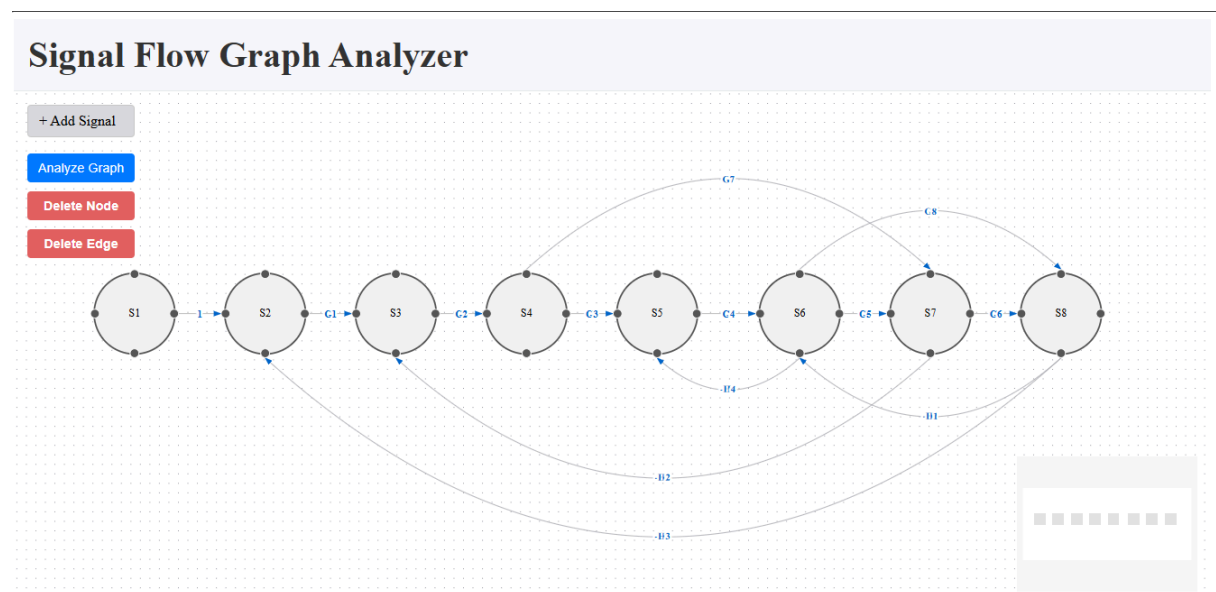

**→ after applying the sheets formula we divide by "Delta" after Multiplication**

## Example 2 From Sheet :

 \end{aligned}$$

The Program's Answer is the Same Exactly as the Sheet's Answer

## The Project's Part II : Routh Stability Criterion

### Introduction:

- This program implements the Routh Stability Criterion, a fundamental method in control systems analysis for determining the stability of a linear time-invariant (LTI) system.
- It analyzes the characteristic equation of a system to assess whether all its poles lie in the left-half of the s-plane (for continuous-time systems), indicating stability.

### Methodology :

- It takes the coefficients of the characteristic equation as input.
- It constructs the Routh array based on these coefficients, following the specific rules of the Routh Stability Criterion.
- It analyzes the first column of the Routh array to determine the stability of the system.
- It identifies the number of sign changes in the first column, which corresponds to the number of roots of the characteristic equation in the right-half of the s-plane (unstable poles).
- Special cases, such as a zero in the first column or an entire row of zeros, are handled

- For the case of an entire row of zeros, It forms an auxiliary polynomial to further analyze the roots on the imaginary axis.

## Examples :

### Routh-Hurwitz Stability Criterion

Enter coefficients of the characteristic equation (separate with commas):

[Analyze Stability](#)

**Result:**

The system is unstable.

Number of poles in the Right-Hand Side of the plane: 2
